Signaling a new day in skin revitalization

Skin Cell Activation™ with PicoSure® treatments

 PicoSure®

When cells speak, the body listens— and responds with more youthful- looking skin

Recent discoveries have begun to reveal the secret language of the body and how cells talk to each other to keep the body healthy. Known as cell signaling or Skin Cell Activation, this “body talk” occurs when cells release proteins, which are then detected by surrounding cells to trigger a healing response—a response that produces new collagen and elastin for healthier-looking skin.

Skin Cell Activation™ is the secret behind Focus™ treatments with the PicoSure® laser.

Inside your cells is newer skin just waiting to get out

Focus treatments with the PicoSure laser activate your body's natural skin cell processes for healthy, more youthful-looking skin. Only Focus treatments lighten unwanted pigment AND uniquely stimulate the production of new collagen and elastin—keys to younger-looking skin—without the pain or downtime of other laser treatments.

- Skin Cell Activation initiates dermal remodeling, reducing the appearance of wrinkles and acne scars
- High and low intensity energy lightens unwanted pigment such as freckles and age spots
- Convenient 10–15 minute treatments
- A few hours of mild redness vs. 2–6 days of downtime with other laser procedures

PicoSure helps remove wrinkles, acne scarring, blemishes and tattoos—and now, with its unique Focus option, PicoSure removes downtime as well.

The perfect treatment when you have *no* time for *downtime*

Other lasers promise to treat wrinkles, acne scars and blemishes. But only PicoSure with Skin Cell Activation uses pressure to deliver impressive results without the pain, discomfort and downtime of other procedures.

- Minimal redness—just 1–3 hours
- No need to cover up
- No need to miss work or leisure activities

Minimal downtime with PicoSure Focus treatments
